

# PAQ System (Perfect Assurance of wire Quality)

## Function

The Miyazaki PAQ system guarantees the wire is free of any surface defects deeper than 0.07 mm (0.0028") or longer than 5 mm (0.197"). A rotating eddy current probe set before the slug former creates an eddy current which detects surface defects and generates a signal to eject the non-conforming blank without stopping the slug former. No customer claims have been received since installing this system.
